Report Reference No. : TRE1405009003 **R/C.....: 40766**
Applicant's name..... : Hytera Communications Co.,Ltd
Address.....: HYT Tower,Hi-Tech Industrial Park North, Nanshan District, Shenzhen China
Manufacturer.....: Hytera Communications Co.,Ltd
Address.....: HYT Tower,Hi-Tech Industrial Park North, Nanshan District, Shenzhen China
Test item description : Digital Mobile Radio
Trade Mark: Hytera
Model/Type reference.....: MD650 VHF
Listed Model(s): MD652 VHF,MD655 VHF, MD656 VHF, MD658 VHF
Standard : FCC Per 47 CFR 2.1091(b)
Date of receipt of test sample.....: May 10, 2014
Date of testing.....: May 10, 2014- Jun 05, 2014
Date of issue.....: Jun 05, 2014
Result.....: PASS

1. Measurement Uncertainty

The information below presents an estimate of the possible errors that are associated with the measurement system.

<u>Description</u>	<u>Error</u>
NARDA Survey Meter	$\pm 3\%$
Repeatability Accuracy	$\pm 7\%$

2. Method of measurement

2.1. EME measurements made on trunk mounted antennas

2.1.1. External vehicle EME measurement

(Antenna mounted in trunk center)

With the survey meter and probe, take ten (10) measurements, at the standard test distance of 60 cm to the antenna, from the back of the vehicle in a vertical line and then average the results. These measurements are taken and recorded at every twenty (20) centimeters over a range starting at twenty (20) centimeters above ground and ending at 2.0 meters.

2.1.2. Internal vehicle EME measurement

(Antenna mounted in trunk center)

While rotating survey meter probe through 180 degrees to ensure that the highest level is found, scan the inside of the vehicle, both front and back seating areas, for the highest level in each location. After the highest level is found, scan vertically making two (2) additional measurements within an area approximately 40 cm wide (representing the width of a person) so as to have a total of three (3) measured points as indicated below that will be averaged

- a) Head area
- b) Chest area
- c) Lower Trunk area

2.2. EME measurements made on center roof mounted antennas

2.2.1. External vehicle EME measurement

With the survey meter and probe, take ten (10) measurements, at the standard test distance of 110 cm from the vehicle-mounted antenna, in a vertical line and then average the results. These measurements are taken and recorded at every twenty (20) centimeters over a range starting at twenty (20) centimeters above ground and ending at 2.0 meters; this would be representative of a person standing next to a vehicle during a mobile radio transmission.

2.2.2. Internal vehicle EME measurement

While rotating survey meter probe through 180 degrees to ensure that the highest level is found, scan the inside of the vehicle, both front and back seating areas, for the highest level in each location. After the highest level is found, scan vertically making two (2) additional measurements within an area approximately 40 cm wide (representing the width of a person) so as to have a total of three (3) measured points as indicated below that will be averaged.

- a) Head area
- b) Chest area
- c) Lower Trunk area

3. Approved Accessories

Antenna:

Model: TQC-150CII
Roof Mount 136MHz-174MHz
Gain: 5.50dBi

Vehicle:

Band: BYD
Model: F6

4. Test Result

The following tables presents detailed MPE measurement information for each test configuration; person external or internal to the vehicle, TX frequency, antenna (location, model and gain), distance from antenna to probe sensor, E/H field measurements, calibration factor, MPE average over body, initial power, power density calc, power density max calc, IEEE controlled and uncontrolled limits, and maximum output power.

The Average over Body test methodology is consistent with IEEE/ANSI C95.3-2002 guidelines

MPE results are based on a 50% duty cycle which is in accordance with the User Manual instructions.

Below is an explanation of how the MPE results are calculated.

External to vehicle - 10 measurements are averaged over the body (Body_Avg).

Internal to vehicle - 3 measurements are averaged over the body (Body_Avg).

Narda Survey Meter measures in percent of the controlled limit. Therefore the averages over the body used in the calculations below reflect percentages

MPE results are based on a Push-To-Talk (PTT) 50% duty cycle in CW mode.

Therefore;

Average _ over _ Body = Body _ Avg *Controlled _ Limit

Pwr _ Density _ Calc = Average _ over _ Body * _ Duty _ Cycle

Pwr_ Density _Max _Calc=Pwr_Density _Calc * $\frac{\text{Max _Output _Power}}{\text{Initial _Output _Power}}$

Note; For Initial Output Power> Max_Output_Power, Max_Output_Power / Initial Output Power = 1
